Frauke Schultze-Lutter is an internationally renowned expert in the early detection of psychosis who has authored more than 100 papers on the topic. Her interest in the early detection of psychoses, especially by subjective disturbances called “basic symptoms”, dates back to her late student years in the early 1990s when she graduated at the department of clinical psychology of the Georg-August University in Göttingen (D) with a diploma thesis on basic symptoms. Working as a (senior) research fellow at the RWTH Aachen (D), the Central Institute of Mental Health in Mannheim (D) and, for 11 years, the Department of Psychiatry and Psychotherapy of the University of Cologne (D), she was significantly involved in the set-up of Europe’s first early detection center, the FETZ, in Cologne in 1997. Her growing interest in developmental aspects that led to the publication of the one early detection instrument for children and adolescents, the Schizophrenia Proneness Instrument, Child & Youth Version (SPI-CY) in 2010, led her to Bern (CH) in 2009. There, she works as senior research fellow (and head a.i.) of the research department of the University Hospital of Child and Adolescent Psychiatry and Psychotherapy, University of Bern, and received the Venia Docendi in 2013.
